| <b>Assessments during topic 2-2</b> <ul style="list-style-type: none"> <li>Teacher assessed task</li> <li>CORE PRACTICAL 1: Determine the acceleration of a freely-falling object</li> <li>Test 2-2. Length: 40-mark / 45 min. Type of questions: short/long answer past exam qu. Content: specification points within chapter 3-5 (up to spec point 19). Earliest assessment date: Mid-November</li> </ul> |                                                                                                                                                                               |
| <b>Chapter 4: Momentum</b>                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                               |
| 21                                                                                                                                                                                                                                                                                                                                                                                                          | understand that momentum is defined as $p = mv$                                                                                                                               |
| 22                                                                                                                                                                                                                                                                                                                                                                                                          | know the principle of conservation of linear momentum, understand how to relate this to Newton's laws of motion and understand how to apply this to problems in one dimension |
| <b>Chapter 5: Forces</b>                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                               |
| 12                                                                                                                                                                                                                                                                                                                                                                                                          | understand scalar and vector quantities and know examples of each type of quantity and recognise vector notation                                                              |
| 13                                                                                                                                                                                                                                                                                                                                                                                                          | be able to resolve a vector into two components at right angles to each other by drawing and by calculation                                                                   |

|    |                                                                                                                                                                                                                                                                                                                     |
|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 14 | be able to find the resultant of two coplanar vectors at any angle to each other by drawing, and at right angles to each other by calculation                                                                                                                                                                       |
| 16 | be able to draw and interpret free-body force diagrams to represent forces on a particle or on an extended but rigid body                                                                                                                                                                                           |
| 17 | be able to use the equation $\Sigma F = ma$ , and understand how to use this equation in situations where $m$ is constant (Newton's second law of motion), including Newton's first law of motion where $a = 0$ , objects at rest or travelling at constant velocity. Use of the term terminal velocity is expected |
| 18 | be able to use the equations for gravitational field strength $W=mg$ and $g=F/m$                                                                                                                                                                                                                                    |
| 19 | CORE PRACTICAL 1: Determine the acceleration of a freely-falling object.                                                                                                                                                                                                                                            |

| Topic 2-3: Mechanics                                                                                                                                                                                                                                                                  |                                                                                                                                                                                        |

Content: specification points within chapter 3-5 (up to spec point 19). Earliest assessment date: First week after the Christmas holiday</li> </ul> |                                                                                                                                                          |
| Chapter 6: Work, Energy and Power                                                                                                                                                                                                                                                                                     |                                                                                                                                                          |
| 25                                                                                                                                                                                                                                                                                                                    | be able to use the equation for work $\Delta W = F\Delta s$ , including calculations when the force is not along the line of motion                      |
| 26                                                                                                                                                                                                                                                                                                                    | be able to use the equation $E = \frac{1}{2}mv^2$ for the kinetic energy of a body                                                                       |
| 27                                                                                                                                                                                                                                                                                                                    | be able to use the equation $\Delta E_{\text{grav}} = mg\Delta h$ for the difference in gravitational potential energy near the Earth's surface          |
| 28                                                                                                                                                                                                                                                                                                                    | know, and understand how to apply, the principle of conservation of energy including use of work done, gravitational potential energy and kinetic energy |
| 29                                                                                                                                                                                                                                                                                                                    | be able to use the equations relating power, time and energy transferred or work done; $P=E/t$ and $P=W/t$                                               |
| 30                                                                                                                                                                                                                                                                                                                    | be able to use the equations:<br>efficiency = useful energy output/total energy input<br>efficiency = useful power output/ total power input             |

## Topic 5: Waves and the particle nature of light

Mathematical skills developed in topic 5:

- using calculators to handle  $\sin x$
- identifying uncertainties in measurements
- using simple techniques to determine uncertainty when data are combined.

### Topic 5-1: Waves and the particle nature of light

#### **Assessments during topic 5-1**

- CORE PRACTICAL 6: Determine the speed of sound in air using a 2-beam oscilloscope, signal generator, speaker and microphone
- Test 5-1. Length: 40-mark / 45 min. Type of questions: short/long answer past exam qu. Content: specification points within chapter 14 + 15 (up to spec point 74). Earliest assessment date: Second week after spring half-term

| Spec                                                    | Students should:                                                                                                                                     |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Chapter 14: Types of Waves</b>                       |                                                                                                                                                      |
| 59                                                      | understand the terms <i>amplitude</i> , <i>frequency</i> , <i>period</i> , <i>speed</i> and <i>wavelength</i>                                        |
| 60                                                      | be able to use the wave equation $v = f\lambda$                                                                                                      |
| 61                                                      | be able to describe longitudinal waves in terms of pressure variation and the displacement of molecules                                              |
| 62                                                      | be able to describe transverse waves                                                                                                                 |
| 63                                                      | be able to draw and interpret graphs representing transverse and longitudinal waves (...)                                                            |
| 65                                                      | Know and understand what is meant by phase (...)                                                                                                     |
| <b>Chapter 15: Transmission and Reflection of Waves</b> |                                                                                                                                                      |
| 64                                                      | CORE PRACTICAL 6: Determine the speed of sound in air using a 2-beam oscilloscope, signal generator, speaker and microphone.                         |
| 68                                                      | be able to use the equation for the speed of a transverse wave on a string $v = \sqrt{T/\mu}$                                                        |
| 71                                                      | know and understand that at the interface between medium 1 and medium 2; $n_1 \sin \theta_1 = n_2 \sin \theta_2$ where refractive index is $n = c/v$ |
| 72                                                      | be able to calculate <i>critical angle</i> using $\sin C = 1/n$                                                                                      |
| 73                                                      | be able to predict whether total internal reflection will occur at an interface                                                                      |
| 74                                                      | understand how to measure the refractive index of a solid material                                                                                   |

### Topic 5-2: Waves and the particle nature of light

#### **Assessments during topic 5-2**

- Teacher assessed task
- 5-2 Multiple choice test (MCQ). Length 15-mark / 20 min. Type of questions: Multiple choice questions. Content: This test covers chapter 14 + 15. Earliest assessment date: Week before the Easter Holiday

|    |                                                                                                                                  |
|----|----------------------------------------------------------------------------------------------------------------------------------|
| 75 | understand the term <i>focal length</i> of converging and diverging lenses                                                       |
| 76 | be able to use ray diagrams to trace the path of light through a lens and locate the position of an image                        |
| 77 | be able to use the equation power of a lens $P = 1/f$                                                                            |
| 78 | understand that for thin lenses in combination $P = P_1 + P_2 + P_3 + \dots$                                                     |
| 79 | know and understand the terms <i>real image</i> and <i>virtual image</i>                                                         |
| 80 | be able to use the equation $(1/u) + (1/v) = (1/f)$ for a thin converging or diverging lens with the real is positive convention |
| 81 | know and understand that magnification = image height/object height and $m = v/u$                                                |
| 82 | Understand what is meant by <i>plane polarisation</i>                                                                            |

|    |                                                                                                                                                                                                                         |
|----|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 88 | understand that waves can be transmitted and reflected at an interface between media                                                                                                                                    |
| 89 | understand how a pulse-echo technique can provide information about the position of an object and how the amount of information obtained may be limited by the wavelength of the radiation or by the duration of pulses |

### Year 12 Exam

Content: Topics 2-4 and associated core practical questions

Assessment date: After the Easter holiday

### Topic 5-3: Waves and the particle nature of light

#### Assessments during topic 5-3

- CORE PRACTICAL 7: Investigate the effects of length, tension and mass per unit length on the frequency of a vibrating string or wire
- CORE PRACTICAL 8: Determine the wavelength of light from a laser or other light source using a diffraction grating
- 5-3 Multiple choice test (MCQ). Length 15-mark / 20 min. Type of questions: Multiple choice questions. Content: This test covers chapter 14 - 16. Earliest assessment date: Last week before summer half-term

### Chapter 16: Superposition of Waves

|    |                                                                                                                                                                 |
|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 63 | be able to draw and interpret graphs representing transverse and longitudinal waves including standing/stationary waves                                         |
| 65 | know and understand what is meant by <i>wavefront</i> , <i>coherence</i> , <i>path difference</i> , <i>superposition</i> , <i>interference</i> and <i>phase</i> |
| 66 | be able to use the relationship between <i>phase difference</i> and <i>path difference</i>                                                                      |
| 67 | know what is meant by a <i>standing/stationary wave</i> and understand how such a wave is formed, know how to identify nodes and antinodes                      |
| 69 | CORE PRACTICAL 7: Investigate the effects of length, tension and mass per unit length on the frequency of a vibrating string or wire.                           |
| 83 | understand what is meant by <i>diffraction</i> and use Huygens' construction to explain what happens to a wave when it meets a slit or an obstacle              |
| 84 | be able to use $n\lambda = d\sin\theta$ for a diffraction grating                                                                                               |
| 85 | CORE PRACTICAL 8: Determine the wavelength of light from a laser or other light source using a diffraction grating.                                             |

### Topic 5-4: Waves and the particle nature of light

#### Assessments during topic 5-4

- Test 5-4. Length: 40-mark / 45 min. Type of questions: short/long answer past exam qu. Content: specification points within topic 5. Earliest assessment date: First week of July

### Chapter 17: Particle Nature of Light

|    |                                                                                                                                                                  |
|----|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 70 | be able to use the equation intensity of radiation $I = P/A$                                                                                                     |
| 86 | understand how diffraction experiments provide evidence for the wave nature of electrons                                                                         |
| 87 | be able to use the de Broglie equation $\lambda = h/p$                                                                                                           |
| 90 | understand how the behaviour of electromagnetic radiation can be described in terms of a wave model and a photon model, and how these models developed over time |
| 91 | be able to use the equation $E = hf$ , that relates the photon energy to the wave frequency                                                                      |
| 92 | understand that the absorption of a photon can result in the emission of a photoelectron                                                                         |
| 93 | understand the terms threshold frequency and work function and be able to use the equation $hf = +1/2mv^2(\text{max})$                                           |
| 94 | be able to use the electronvolt (eV) to express small energies                                                                                                   |

|    |                                                                                                                                                                                                                           |
|----|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 95 | understand how the photoelectric effect provides evidence for the particle nature of electromagnetic radiation                                                                                                            |
| 96 | understand atomic line spectra in terms of transitions between discrete energy levels and understand how to calculate the frequency of radiation that could be emitted or absorbed in a transition between energy levels. |

## **A Level Physics Exam Preparation**

Exam Board: Pearson Edexcel

Specification: 9PH0

| 53                                                                                                                                                                                                                                                                                                                         | be able to use the Hooke's law equation, $\Delta F = k\Delta x$ , where k is the stiffness of the object |

|    |                                                                                                                                                                                                                                                                                                    |
|----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 54 | <p>understand how to use the relationships</p> <ul style="list-style-type: none"> <li>(tensile or compressive) stress = force/cross-sectional area</li> <li>(tensile or compressive) strain= change in length/original length</li> <li>Young modulus = stress/strain</li> </ul>                    |
| 55 | <p>a. be able to draw and interpret force-extension and force-compression graphs</p> <p>b. understand the terms <i>limit of proportionality</i>, <i>elastic limit</i>, <i>yield point</i>, <i>elastic deformation</i> and <i>plastic deformation</i> and be able to apply them to these graphs</p> |
| 56 | be able to draw and interpret tensile or compressive stress-strain graphs, and understand the term <i>breaking stress</i>                                                                                                                                                                          |
| 57 | CORE PRACTICAL 5: Determine the Young modulus of a material                                                                                                                                                                                                                                        |
| 58 | be able to calculate the elastic strain energy in a deformed material sample, using the equation $\Delta E = 1/2 F \Delta x$ and from the area under the force-extension graph (The estimation of area and hence energy change for both linear and non-linear force-extension graphs is expected.) |

### Year 12 Exam

Content: Topics 2-4 and associated core practical questions

Assessment date: After the Easter holiday

## Topic 6: Further Mechanics

Mathematical skills developed in topic 6;

- translating between degrees and radians
- using trigonometric functions

### Topic 6-1: Further Mechanics

#### Assessments during topic 6-1

- CORE PRACTICAL 9: Investigate the relationship between the force exerted on an object and its change of momentum
- CORE PRACTICAL 10: Use ICT to analyse collisions between small spheres, e.g. ball bearings on a table top
- 6-1 Multiple choice test (MCQ). Length 15-mark / 20 min. Type of questions: Multiple choice questions. Content: This test covers chapters 4 + 18. Earliest assessment date: Last week before the Easter holiday

| Spec                                    | You should:                                                                                                       |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Chapter 18 (and part of 4) - Collisions |                                                                                                                   |
| 97                                      | understand how to use the equation impulse = $F\Delta t = \Delta p$ (Newton's second law of motion)               |
| 98                                      | CORE PRACTICAL 9: Investigate the relationship between the force exerted on an object and its change of momentum. |
| 99                                      | understand how to apply conservation of linear momentum to problems in two dimensions                             |
| 100                                     | CORE PRACTICAL 10: Use ICT to analyse collisions between small spheres, e.g. ball bearings on a table top.        |
| 101                                     | understand how to determine whether a collision is elastic or inelastic                                           |
| 102                                     | be able to derive and use the equation $E_k = p^2/2m$ for the kinetic energy of a non-relativistic particle       |

### Topic 6-2: Further Mechanics

#### Assessments during topic 6-2

- Test 6-2. Length: 40-mark / 45 min. Type of questions: short/long answer past exam qu. Content: specification points within chapters 12 + 13. Expected assessment date: Mid-May

#### Chapter 19: Motion in a Circle

|     |                                                                                                                                                       |
|-----|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| 103 | be able to express angular displacement in radians and in degrees, and convert between these units                                                    |
| 104 | understand what is meant by <i>angular velocity</i> and be able to use the equations $v = \omega r$ and $T = 2\pi/\omega$                             |
| 105 | be able to use vector diagrams to derive the equations for centripetal acceleration $a = v^2/r = r\omega^2$ and understand how to use these equations |
| 106 | understand that a resultant force (centripetal force) is required to produce and maintain circular motion                                             |
| 107 | be able to use the equations for centripetal force $F = ma = mv^2/r = mr\omega^2$                                                                     |

### Topic 9: Thermodynamics

Mathematical skills developed in topic 9;  
substituting numerical values into algebraic equations  
using appropriate units for physical quantities.

#### Topic 9-1: Thermodynamics

#### Assessments during topic 9-1

- CORE PRACTICAL 12: Calibrate a thermistor in a potential divider circuit as a thermostat
- CORE PRACTICAL 13: Determine the specific latent heat of a phase change
- 9-1 Multiple choice test (MCQ). Length 15-mark / 20 min. Type of questions: Multiple choice questions. Content: This test covers chapters 27 + 28. Expected assessment date: Two weeks before the end of summer term

**Spec**   **You should:**

|     |                                                                                                                                       |
|-----|---------------------------------------------------------------------------------------------------------------------------------------|
| 144 | be able to use the equations $\Delta E = mc\Delta\theta$ (...)                                                                        |
| 145 | CORE PRACTICAL 12: Calibrate a thermistor in a potential divider circuit as a thermostat.                                             |
| 147 | understand the concept of <i>internal energy</i> as the random distribution of potential and kinetic energy amongst molecules         |
| 148 | understand the concept of <i>absolute zero</i> and how the average kinetic energy of molecules is related to the absolute temperature |

#### Chapter 28: Change of State

|     |                                                                                                                                       |
|-----|---------------------------------------------------------------------------------------------------------------------------------------|
| 144 | be able to use the equations $\Delta E = mc\Delta\theta$ and $\Delta E = L\Delta m$                                                   |
| 146 | CORE PRACTICAL 13: Determine the specific latent heat of a phase change.                                                              |
| 147 | understand the concept of <i>internal energy</i> as the random distribution of potential and kinetic energy amongst molecules         |
| 148 | understand the concept of <i>absolute zero</i> and how the average kinetic energy of molecules is related to the absolute temperature |
